**APPENDIX. Calculations for Generalizability Estimate of FTF versus Waitlist Effectiveness for Decliner Population with Standard Error**

*Notation:* Let  $n_{Dk0}$  be the number of decliner participants in the  $k^{\text{th}}$  quintile at baseline. Let  $N_{D0}$  be the total number of decliner participants at baseline. Let  $n_{Fk3}$  and  $n_{Wk3}$  be the number of FTF and Waitlist participants in the  $k^{\text{th}}$  quintile at 3 months, respectively. Let  $\bar{Y}_{Fk3}$  and  $\bar{Y}_{Wk3}$  be the mean of Y for the  $k^{\text{th}}$  quintile FTF and Waitlist participants, measured at 3 months, respectively. Let  $S_{Fk3}^2$  and  $S_{Wk3}^2$  be the sample variances for the FTF and Waitlist participants in the  $k^{\text{th}}$  quintile, measured at 3 months.

The following gives an estimate of  $\tau_D$  = the FTF versus Waitlist effect for the decliner population and its standard error:

$$\tau_D = \sum_{k=1 \text{ to } 5} (n_{Dk0}/N_{D0}) (\bar{Y}_{Fk3} - \bar{Y}_{Wk3})$$

For each quintile k, calculate mean Y for FTF  $k^{\text{th}}$  quintile – mean Y for Waitlist  $k^{\text{th}}$  quintile and multiply this quantity by baseline proportion of decliners in  $k^{\text{th}}$  quintile. Then  $\tau_D$  is the sum of these quantities over all five quintiles.

The following gives the standard error:

$$Se(\tau_D) = \left\{ \sum_{k=1 \text{ to } 5} (n_{Dk0}/N_{D0})^2 (S_{Fk3}^2/n_{Fk3} + S_{Wk3}^2/n_{Wk3}) \right\}^{1/2}$$

For each quintile k, calculate the square of the se for FTF  $k^{\text{th}}$  quintile and add to square of se for Waitlist  $k^{\text{th}}$  quintile. Multiple this quantity by square of baseline proportion of decliners in  $k^{\text{th}}$  quintile. Then  $Se(\tau_D)$  is the square root of 1/5 times the sum of these quantities over all five quintiles.
