

Table 2. Published Studies Examining Application of Inpatient DBT (alphabetical listing)

Citation	Inpatient Setting	DBT Sample	Comparison Sample	DBT Modification/ Intervention	Outcome Measures	Results	Effect Size
36	Hospital unit for personality disorders Ashville, NC, USA	130 patients discharged from the hospital unit (79% women, Median age = 30, Age range = 16-57 years)	Patients in a General Adult Psychiatry Unit receiving treatment as usual (not DBT). Not assessed more specifically. (Demographics not reported)	<p><u>Treatment Duration:</u> 3 months</p> <p><u>Individual Therapy:</u> Frequency not reported; administered by psychodynamically trained therapists adhering to Linehan's (1993) treatment hierarchy</p> <p><u>Group Skills Training:</u> 90 minutes per week; focused on attentional training, emotion regulation, distress tolerance/ reality acceptance, and interpersonal effectiveness</p> <p><u>Consultation:</u> Therapists available during morning rounds</p> <p><u>Therapist Consultation Group Included;</u> frequency not reported</p> <p><u>Additional Components:</u></p> <p><i>Homework groups:</i> Led by nurses to review assignments from skills training.</p> <p><i>Other therapeutic groups and activities:</i> To address other</p>	Monthly rates of parasuicidal behaviors based on incident reports from the units for the months before, during, and after the transition to DBT	<p>Mean monthly rates of parasuicide decreased for the DBT group after the introduction of DBT</p> <p>No change in mean monthly rates of parasuicide for the comparison group during this time period</p>	Not given

				aspects of individual/ community functioning			
13	University hospital unit for borderline personality disorder Freiburg, Germany	31 women (<i>Mean</i> age = 29.1 years, <i>Range</i> = 18- 44)	19 female (waitlisted) treatment as usual controls at admission (19 women at follow-up). TAU = professional mental health care in the community [some inpatient care (<i>n</i> =12) & outpatient care (<i>n</i> = 14)]. Not reported more specifically. (<i>Mean</i> age = 29.5 years, <i>Range</i> = 19-38).	<u>Treatment Duration</u> : 3 months <u>Individual Therapy</u> : 2 hours per week; followed standard DBT protocol <u>Group Skills Training</u> : 2 hours per week; followed standard DBT manual <u>Consultation</u> : Available through milieu support <u>Therapist Consultation Group</u> : 2 hours per week <u>Additional Components</u> : <i>Group psychoeducation</i> : 1 hour per week <i>Peer group meetings</i> : 2 hours per week <i>Mindfulness group</i> : 1 hour per week <i>Individual body- oriented therapy</i> : 1.5 hours per week	BDI DES GAF HAMA HAMD IIP LPC SCL-90-R STAI STAXI Assessed at pretreatment and 1 month post discharge	DBT group showed significant improvement on all outcomes except anger 1- month post treatment (finding was maintained when non- completers were included in analysis). TAU group showed no significant change on any measure 1- month post treatment Fewer DBT patients engaged in self-harm behavior at 1- month post treatment than TAU group. DBT patients improved significantly more than TAU group on	Effect sizes (<i>d</i>) for pre- post ranged from from .12 (STAXI) to 1.21 (GAF) in the DBT group and from .00 (IIP) to .15 (STAI) in the comparison group For DBT groups: DES, <i>d</i> = .53 GAF, <i>d</i> = 1.21 HAMA, <i>d</i> = .52 STAI, <i>d</i> = 1.02 BDI, <i>d</i> = .90 IIP, <i>d</i> = .60 STAXI, <i>d</i> = .12 SCL-90-R, <i>d</i> = .84 Effect sizes (<i>f</i> ²) for amount of variance due to group membership varied between .07 (IIP) and .26 (BDI) BDI, <i>f</i> ² = .26 DES, <i>f</i> ² = .04 GAF, <i>f</i> ² = .12 HAMA, <i>f</i> ² = .09 HAMD, <i>f</i> ² = .13 IIP, <i>f</i> ² = .07 SCL-GSI, <i>f</i> ² = .15 STAI, <i>f</i> ² = .25 STAXI, <i>f</i> ² = --

						depression, global functioning, anxiety, and interpersonal problems 13 patients in DBT group met criteria for clinically relevant improvement. No patients in the TAU group met these criteria.	
32	Psychiatric hospital Unit Freiburg, Germany	24 women (Mean age = 28.3 years, Range = 17.4-44.4 years)	None	<u>Treatment Duration:</u> 3 months Specific components of treatments not reported <u>Treatment delivered in 3 phases:</u> <i>Phase 1:</i> Analysis of target behaviors (beginning with behavior that got them hospitalized) and develop a treatment target <i>Phase 2:</i> Theoretical training of patients, acquisition of specific skills, contingency management <i>Phase 3:</i> Discharge planning and establishment of contact with the therapist that	BDI DES HAMA HAMD LPC SCL-90-R STAI STAXI Assessed at pretreatment and 1 month post discharge	Significant post treatment reductions in dissociation, depression, anxiety, frequency of self-injury and several symptoms on the SCL-90-R (e.g., somatization, depression, aggression, psychoticism, total stress)	Mean effect size (ES) of therapy with regard to reduction in symptoms ranges from .69 (STAI) to 1.4 (Compulsiveness) Dissociation, ES = 1.04 BDI, ES = 1.30 STAI, ES = .69 Somatization, ES = 1.14 Compulsive, ES = 1.4 Soc Insec, ES = .97 Depression, ES = .91 Anxiety, ES = 1.08 Aggression, ES = .72 PhobicThought, ES=1.03 Paranoia, ES = .82 Tot Psychoticism, ES = 1.02 Total Stress, ES = 1.08 Intensity, ES = 1.13 Symptoms, ES = 1.01 Fq Self Injury, ES = .25 STAXI, ES = .10 HAMA-Tot, ES = .15 HAMD, ES = .17

				will continue treatment.			
33	General child and adolescent unit Manitoba, Winnipeg, Canada	32 adolescents at admission 26 adolescents at follow up (Total sample at admission (n = 62) <i>Mean</i> age = 15.4, <i>Range</i> = 14-17, 52 girls) No demographic differences between DBT and Comparison groups at admission	30 adolescents at admission 27 adolescents at follow up TAU = Daily psychodynamic group, weekly individual psychodynamic therapy provided by psychiatrist, and psychodynamic milieu. Medication management as needed.	<u>Treatment Duration:</u> 2 weeks <u>Individual Therapy:</u> 2 times per week; reviewed diary cards and conducted behavioral and solution analyses <u>Group Skills Training:</u> 45-75 minute sessions daily; adapted DBT curriculum for daily use <u>Consultation:</u> Available on DBT milieu <u>Therapist Consultation Group:</u> For DBT therapists and nurses; frequency not reported <u>Additional Components:</u> <i>Ancillary treatment:</i> As needed	BDI (13) LPC SIQ Adherence to follow up recommendations Behavioral incidents on unit ER visits Hospitalizations Assessed at pre-treatment, discharge, and 1 year post discharge	DBT group demonstrated a greater reduction in behavioral incidents during admission than TAU group Significant reductions in parasuicidal behavior, depressive symptoms, and suicidal ideation at 1 year for both groups; no significant between group differences	BDI-13 DBT, ES = 1.67 TAU, ES = 1.05 SIQ DBT, ES = 2.12 TAU, ES = 1.36 KHS DBT, ES = .73 TAU, ES = .33 LPC DBT, ES = .63 TAU, ES = .73
42	Psychiatric hospital unit Manitoba, Winnipeg, Canada	Case study: One girl (Age = 16)	None	<u>Treatment Duration:</u> Not reported <u>Individual Therapy:</u> 2 times per week; reviewed diary cards and conducted behavioral and solution analyses <u>Group Skills Training:</u> 45-75 minute sessions daily; adapted DBT curriculum for daily use	BDI (13) Parasuicide Count RSIQ-J Assessed at pre-treatment, and 1 year post discharge	13-item BDI score dropped from 28 at admission to 5 at 1-year follow-up Suicidal Ideation dropped from 82 at admission to 17 at 1-year follow-up.	Not given

				<p><u>Consultation</u>: available from nurse</p> <p><u>Therapist Consultation Group</u>: biweekly for DBT therapists</p> <p><u>Additional Components</u>:</p> <p><i>Family meetings</i> at admission and discharge.</p>		<p>Parasuicide count dropped from 143 in the year prior to admission to 113 in the year following discharge.</p> <p>No re-hospitalizations in the year post-discharge.</p> <p>(Statistical significance not reported)</p>	
39	Long-term follow-up to 13	31 completers from 13	None	See: Bohus et al. 2004	<p>See: Bohus, et al. 2004</p> <p>Assessed at 1, 8, and 20 months post-discharge</p>	<p>Improvements in Global Severity Index were maintained throughout follow-up period.</p> <p>At 1 month follow up 45% of completers showed clinically significant improvement and were characterized as functional. 47% of completers were characterized as functional at 8 month</p>	<p>T1: GSI, $d = 1.0$ BDI, $d = 0.9$ GAF, $d = 0.59$ STAI, $d = 0.85$ IIP, $d = 0.6$ DES, $d = 0.95$ HAMA, $d = 0.65$ HAMD, $d = 0.6$ STAXI, $d = \underline{0.15}$</p> <p>T2: GSI, $d = 1.0$ BDI, $d = 1.0$ GAF, $d = 0.59$ STAI, $d = 0.65$ IIP, $d = 0.35$ DES, $d = 0.79$ HAMA, $d = 0.45$ HAMD, $d = 0.7$ STAXI, $d = \underline{0.35}$</p> <p>T3: GSI, $d = 1.7$ BDI, $d = 1.3$</p>

					<p>follow-up and 50% of completers were characterized as functional at 20 month follow-up.</p> <p>Low levels of psychopathology and symptoms improvement at 1-month follow-up were maintained at the 8 and 20 month follow-up points.</p> <p>Rates of self-injury for the 4 weeks preceding each measurement points differed (74% before admission, 35% before 1 month point, 57% before 8 month point, and 23% before 20 month point)</p> <p>Significant reductions in suicide attempts were also maintained across the follow-up</p>	<p>GAF, $d = 0.7$ STAI, $d = 0.95$ IIP, $d = 0.7$ DES, $d = 0.9$ HAMA, $d = 0.8$ HAMD, $d = 0.9$ STAXI, $d = \underline{0.3}$</p>
