$n_{wt}$  refers to weighted frequency. Totals for weighted frequencies differ slightly from unweighted frequency totals. Weighted frequencies are discretely rounded. Percentages are calculated from unrounded weighted frequencies.

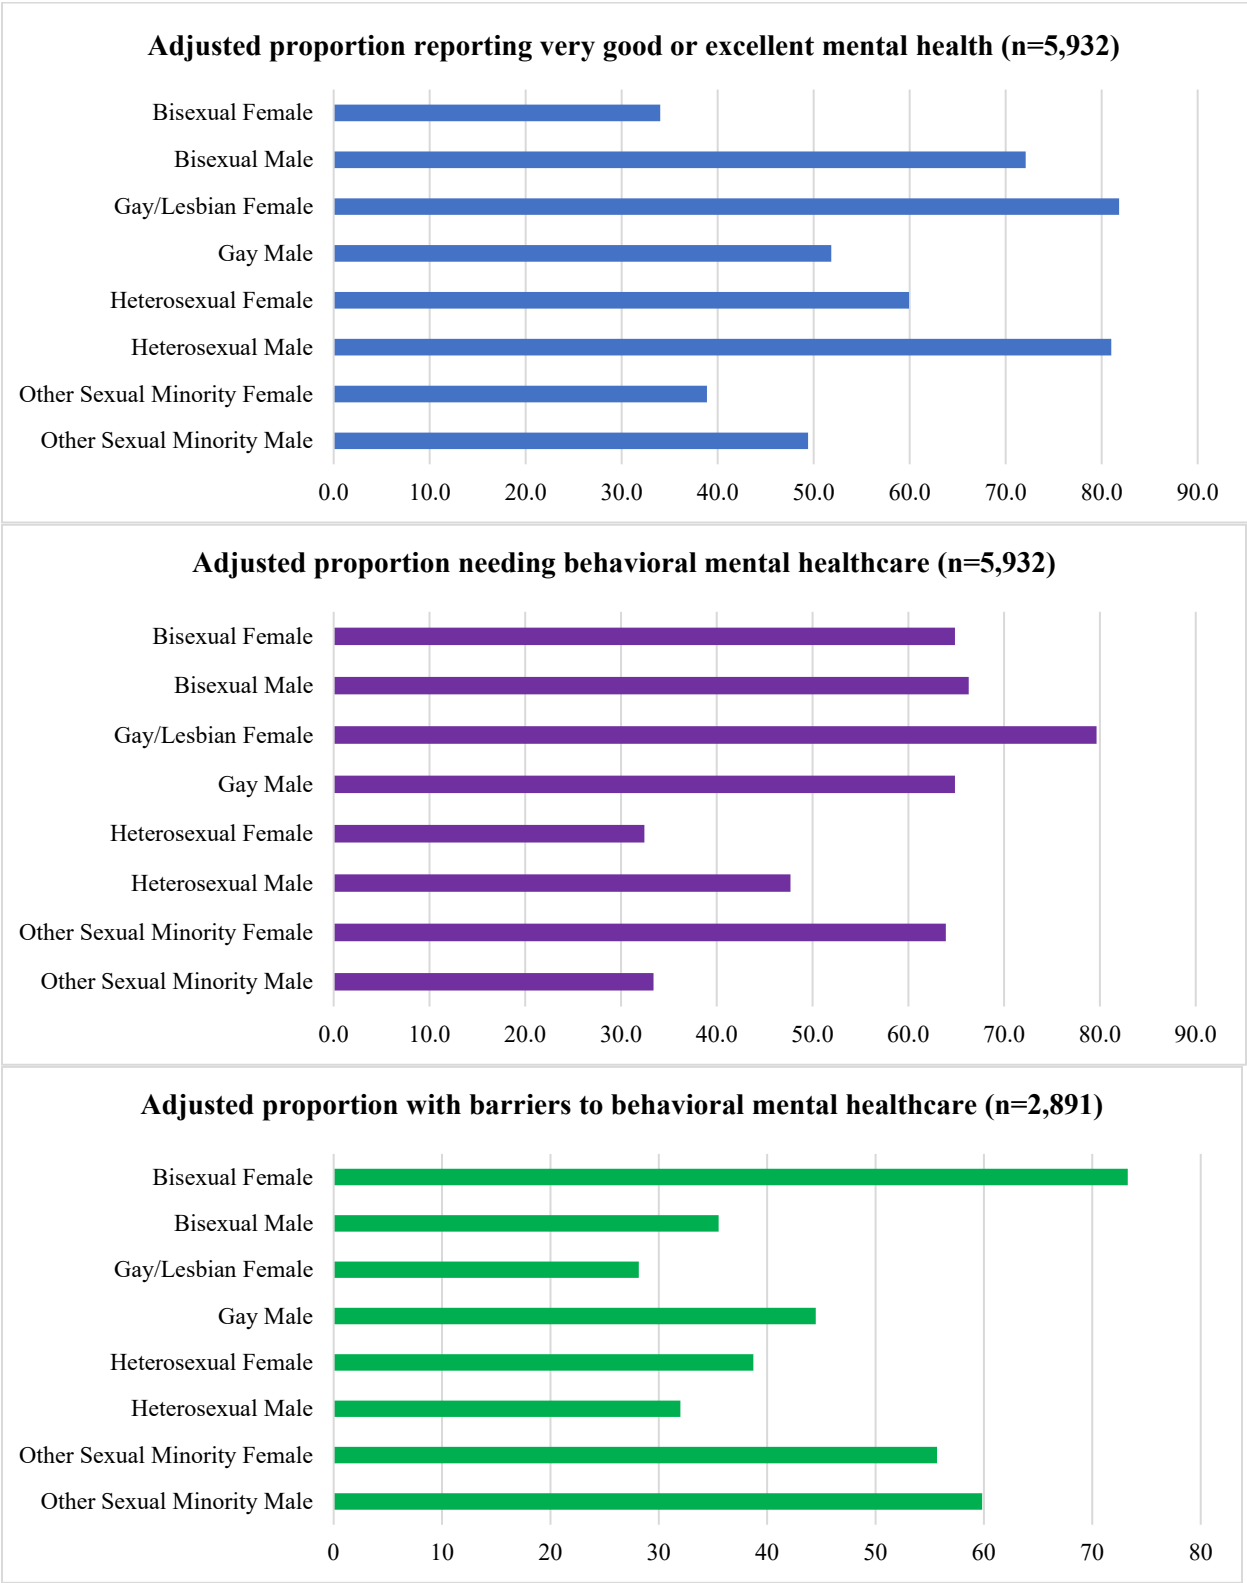

<sup>1</sup>Significant ( $p < .05$ ) associations bolded.

<sup>2</sup>Proportion differences tested using Chi-Square test.

<sup>3</sup>Proportion differences tested using Cochran-Armitage trend test.

<sup>4</sup>Differences with sociodemographic factors tested using Kruskal-Wallis test for multicategorical factors, Cochran-Armitage test of trend for binary factors, and Mantel-Haenzsel Chi-Square test for ordinal factors.

**Supplemental Figure.** Adjusted proportions of behavioral mental healthcare factors across sexual identity and sex.

Proportions are adjusted for age, race/ethnicity, region, education, income, employment, and marital status.
