

Resources for Treating Anxiety Disorders

Textbook of Anxiety Disorders, Second Edition

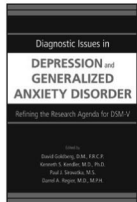

Edited by Dan J. Stein, M.D., Ph.D., Eric Hollander, M.D.,
and Barbara O. Rothbaum, Ph.D., A.B.P.P.

This new edition features new chapters on anxious traits and temperaments, the neuropsychology of anxiety disorders, and anxiety and insomnia. Other chapters have been entirely rewritten by new authors to provide fresh insight into such topics as integrated treatment of anxiety disorders; pharmacotherapy for GAD, OCD, and panic disorder; psychotherapy for OCD and PTSD; anxiety disorders in the elderly; anxiety accompanying substance abuse; and the economic and social costs of anxiety. All chapters have been expanded and fully updated with new research findings, and each now includes a concise summary of key clinical points to help readers put those findings into practice.

This important new resource offers both clinicians and researchers a single-volume resource that covers not only advances in clinical interventions but also the latest advances in theoretical knowledge.

Diagnostic Issues in Depression and Generalized Anxiety Disorder Refining the Research Agenda for DSM-V

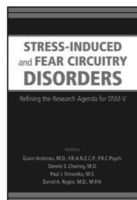

Edited by David Goldberg, D.M., F.R.C.P, Kenneth S. Kendler, M.D., Paul J. Sirovatka, M.S.,
and Darrel A. Regier, M.D., M.P.H.

This book acts as a guidepost for the entire DSM process. It reviews recent scientific advances in our understanding of the interrelationship between GAD and MD, summarizes the body of evidence into a few broad conclusions, and reflects on the implications of these findings for future nosologic efforts. The contributing authors review conceptual issues and empirical data from a variety of perspectives, including genetics, biology, treatment, development, course, predictors, disability, and psychosocial stressors.

Diagnostic Issues in Depression and Generalized Anxiety Disorder develops operationalized criteria for nosologic decisions that enable clinicians to bridge the gap between data and diagnostic recommendations. Not only does the methodology of investigating an active interchange between empirical and conceptual perspectives shed new light on the relationship between GAD and MD, but it also carries implications for the rest of DSM-V.

Stress-Induced and Fear Circuitry Disorders Refining the Research Agenda for DSM-V

Edited by Gavin Andrews, M.D., Dennis S. Charney, M.D., Paul J. Sirovatka, M.S., and Darrel A. Regier, M.D., M.P.H.

This volume summarizes current research to determine whether a specific group of stress-induced and fear-based disorders form a distinct syndrome independent from other anxiety disorders. Intended to contribute to DSM-V revisions regarding classification of these disorders, *Stress-Induced and Fear Circuitry Disorders* reflects findings that may lead to more refined treatments for these conditions based on a better understanding of the biological and environmental factors that contribute to their development.

Thirty international authorities clarify how these disorders develop and what factors contribute to symptomatology. Focusing on posttraumatic stress disorder, panic disorder and agoraphobia, social phobia, and specific phobia, the authors explore the possibility of linking the classification and etiology of these conditions by showing that they may be closely related in terms of brain pathophysiology. By offering important new ways of thinking about these disorders, the book not only allows researchers to more accurately assess these diagnostic classifications but also can help clinicians more effectively communicate with patients regarding the nature of their illness and its treatment.
